

AMENDMENTS TO THE CLAIMS

LISTING OF CLAIMS IN THE CASE

The following listing of claims replaces all prior versions:

1. (Currently Amended) In a digital electronic system, a method of ~~displaying~~ storing information comprising the steps of:

[[a)] maintaining an intelligent filter that records hypertext documents that were previously accessed by a viewer of said digital electronic system;

[[b)] monitoring datacast information decoded from a digital ~~television~~ broadcast signal to identify newly received hypertext documents, wherein said monitoring comprises:

tuning a tuner to a selected channel within said digital broadcast signal and receiving datacast information therefrom for a time period;

identifying newly received hypertext documents from said received datacast information;

updating said selected channel and initializing said time period at expiration of said time period; and

repeating said tuning, identify, and updating; and

[[c)] storing into a cache memory any of said newly received hypertext documents that are recorded in said intelligent filter.]]

d) ~~receiving, from a viewer, an identifier of a selected hypertext document; and~~
~~— e) provided said selected hypertext document is located within said cache memory, accessing said selected hypertext document from said cache memory and displaying said selected hypertext document on a display screen of said digital electronic system.~~

2. (Previously Presented) A method as described in Claim 1 wherein said datacast information comprises a domain of hypertext documents that are periodically broadcast and wherein said digital electronic system is a digital television system.

3. (Currently Amended) A method as described in Claim 2 further comprising ~~the step of f) provided said a~~ selected hypertext document is not located within said cache memory, obtaining said selected hypertext document upon its next occurrence within said datacast information and displaying said selected hypertext document on ~~said a~~ display screen of said digital television system.

4. (Currently Amended) A method as described in Claim 2 further comprising ~~the step of f) provided said selected hypertext document is not located within said cache memory, obtaining said selected hypertext document from a digital modem coupled to the word~~

wide web and displaying said selected hypertext document on said a display screen of said digital television system.

5. (Currently Amended) A method as described in Claim 1 wherein said maintaining step a) comprises the steps of:

[[a1)]] receiving and recording identifiers of hypertext documents accessed by said viewer;

[[a2)]] recording a count associated with each identifier of hypertext documents received by said ~~step a1)~~, said count indicating the number of times each recorded hypertext document was accessed by said viewer; and

[[a3)]] ranking said identifiers of said intelligent filter based on their associated counts.

6. (Currently Amended) A method as described in Claim 5 wherein said maintaining step a) further comprises the ~~step of a4)~~ removing from said intelligent filter any recorded identifier of a hypertext document that has not been accessed by said viewer for a predetermined time period.

7. (Previously Presented) A method as described in Claim 1 wherein said hypertext documents are web pages and wherein said identifiers are web page addresses.

8. (cancelled)

9. (Currently Amended) In a client-side digital television system, a method of ~~displaying~~ storing information comprising the steps of:

[[a)]] maintaining an intelligent filter that records hypertext documents based on the frequency that hypertext documents were previously accessed by a viewer of said digital television system;

[[b)]] monitoring datacast information decoded from a received digital television broadcast signal to identify newly received hypertext documents, said ~~step b)~~ monitoring comprising the steps of:

[[b1)]] sequentially scanning a first tuner of said digital television system over channels of said digital television broadcast signal for a predetermined time period for each scanned channel; and

[[b2)]] at each scanned channel, identifying newly received hypertext documents;

repeating said sequentially scanning said first tuner for a predetermined period of time for each scanned channel to identify newly received hypertext documents; and

[[c)]] storing into a cache memory any of said newly received hypertext documents that are recorded in said intelligent filter. [[;]]

~~d) receiving, from a viewer, an identifier of a selected hypertext document; and~~

~~e) provided said selected hypertext document is located within said cache memory, accessing said selected hypertext document from said cache memory and displaying said selected hypertext document on a display screen of said digital television system.~~

10. (currently amended) A method as described in Claim 9 further comprising ~~the step of f)~~ using a second tuner of said digital television system to display contents of a selected channel to said viewer on ~~said~~ a display screen of said digital television system.

11. (original) A method as described in Claim 10 wherein said datacast information comprises a domain of hypertext documents that are periodically broadcast.

12. (currently amended) A method as described in Claim 10 further comprising ~~the step of f)~~ provided said selected hypertext document is not located within said cache memory, obtaining ~~said~~ a selected hypertext document upon its next occurrence within said datacast information and displaying said selected hypertext document on ~~said~~ a display screen of said digital television system.

13. (currently amended) A method as described in Claim 10 further comprising ~~the step of f)~~ provided ~~said~~ a selected hypertext

document is not located within said cache memory, obtaining said selected hypertext document from a digital modem coupled to the world wide web and displaying said selected hypertext document on said a display screen of said digital television system.

14. (currently amended) A method as described in Claim 10 wherein said maintaining step a) comprises ~~the steps of:~~

[[a1)]] receiving and recording identifiers of hypertext documents accessed by said viewer;

[[a2)]] recording a count associated with each identifier received by said step a1), said count indicating the number of times each recorded hypertext document was accessed by said viewer;

[[a3)]] ranking said identifiers of said intelligent filter based on their associated counts; and

[[a4)]] removing from said intelligent filter any recorded identifier of a hypertext document that has not been accessed by said viewer for a predetermined time period.

15. (Previously Presented) A method as described in Claim 10 wherein said hypertext documents are web pages and wherein said identifiers are web page addresses.

16. (Currently Amended) A digital electronic system comprising:
a display screen;
a tuner coupled to receive a digital television broadcast signal;
an intelligent controller coupled to said display screen and coupled to said tuner, said intelligent controller comprising a processor coupled to a bus and a memory unit containing instructions that when executed implement a method of displaying information comprising the steps of:

[[a))] maintaining an intelligent filter that records hypertext documents that were previously accessed by a viewer of said digital electronic system;

[[b))] monitoring datacast information decoded from said digital television broadcast signal to identify newly received hypertext documents, wherein said monitoring comprises:

tuning a tuner to a selected channel within said digital broadcast signal and receiving datacast information therefrom for a time period;

identifying newly received hypertext documents from said received datacast information;

updating said selected channel and initializing said time period at expiration of said time period; and

repeating said tuning, identify, and updating; and

[[c))] storing into a cache memory any of said newly received hypertext documents that are recorded in said intelligent filter.[:)]

~~d) receiving, from a viewer, an identifier of a selected
hypertext document; and~~

~~e) provided said selected hypertext document is located
within said cache memory, accessing said selected hypertext
document from said cache memory and displaying said selected
hypertext document on said display screen.~~

17. (Previously Presented) A digital electronic system as described in Claim 16 wherein said datacast information comprises a domain of hypertext documents that are periodically broadcast.

18. (currently amended) A digital electronic system as described in Claim 17 wherein said method further comprises ~~the step of f)~~ provided said selected hypertext document is not located within said cache memory, obtaining said selected hypertext document upon its next occurrence within said datacast information and displaying said selected hypertext document on said display screen.

19. (Currently Amended) A digital electronic system as described in Claim 17 wherein said method further comprises ~~the step of f)~~ provided ~~said a~~ selected hypertext document is not located within said cache memory, obtaining said selected hypertext document from a digital

modem coupled to the word wide web and displaying said selected
hypertext document on said display screen.

20. (Currently Amended) A digital electronic system as described
in Claim 16 wherein said maintaining step a) comprises the steps of:

[[a1)]] receiving and recording identifiers of hypertext documents
accessed by said viewer;

[[a2)]] recording a count associated with each identifier of of
hypertext documents received by said step a), said count indicating the
number of times each recorded hypertext document was accessed by said
viewer; and

[[a3)]] ranking said identifiers of said intelligent filter based on
their associated counts.

21. (Currently Amended) A digital electronic system as described
in Claim 20 wherein said maintaining step a) further comprises the step
of a4) removing from said intelligent filter any recorded identifier of a
hypertext document that has not been accessed by said viewer for a
predetermined time period.

22. (Previously Presented) A digital electronic system as
described in Claim 16 wherein said hypertext documents are web pages
and wherein said identifiers are web page addresses.

23. (Cancelled)
